Laser Aesthetics of Texas

Invigorate...

Velasmooth®

treatment for cellulite

Throw your cover-up away! With the Velasmooth® solution, you can proudly wear your bikini without fear of unsightly cellulite.

This non-invasive procedure has a 100% success rate in removing that cottage cheese look from around your hips, thighs, stomach and even your buttocks.

We use a device that emits a radio frequency energy and infrared light to melt away the unwanted fat and tighten the skin. The whole non-surgical procedure takes only 40 minutes and can be done in the doctor's office.

Safer and less costly than liposuction, the Velasmooth® solution will give your skin a healthier glow, better tone and remove inches of unwanted cellulite.

Rejuvenate...

Spider vein removal

Imagine enjoying the summer while wearing your shortest shorts without

the embarrassment of ugly spider veins or broken blood vessels. When you're walking down the street, you'll know that your legs are looking healthy and vibrant.

You can have beautiful legs again with our Vantage™ treatment system. Laser energy absorbed by the pigment in the inflamed or swollen blood vessels will gradually cause them to disappear. No anesthesia or pain medication is needed and the treatments are quick and safe.

Skin rejuvenation

Bring back the skin of your youth with Laser Genesis™ non-ablative skin rejuvenation. Rosacea and other facial redness will be eliminated and pore size and acne scars will be reduced. Laser Genesis also helps to stimulate the production of collagen and elastin, giving your face a youthful, softer complexion. Gradually, your skin will become smoother, and develop a more even skin tone. You'll look years younger!

Exhilarate.

Hair removal

Painful waxing, messy creams and razor burns are now a thing of the past. You

can remove unwanted hair quickly, easily and have that perfect skin you've always wanted with our Coolglide Vantage™ laser technology.

This breakthrough technology is effective on any part of your body. Legs, arms, face, bikini area, and even your upper lip can be treated. Superior to electrolysis, non-invasive laser light energy is absorbed by the pigment in hair follicles, destroying scores of hair follicles at once and providing long-lasting results.

You'll wear protective goggles and a gel will be applied to the area to be treated. We'll glide the laser handpiece over the treatment area, destroying the active hair follicles. After the treatment, a cool compress is applied to the area to hasten healing. Often, the only noticeable skin change is a temporary redness that disappears in an hour or two.
